The University has been conducting hazardous materials surveys prior to beginning most of the construction projects for the last 5 years. This has created a significant, but incomplete amount of data. We'd like help in creating a graphical system to identify all of the zones that have been surveyed and the specific spots of each known survey.

We are looking for a system to help identify areas that have not been tested and to be able to reprint reports for areas that have existing reports but will undergo new construction.

The system should initially share its data between the Capital Projects Office, the Facilities Services Department and the UW's Environmental Health and Safety Department.

Data will need to display information on a map by building and if possible by floor within the building.

A Non-Disclosure Agreement (NDA) may need to be signed by all members of this group before survey zones and data points will be made available.
