Lexical Types

- Motivation for lexical hierachy
- Default inheritance
- Tour of the lexeme hierarchy
- The Case Constraint
- pos vs. lexeme

## Motivation

- We've streamlined our grammar rules...
  - ...by stating some constraints as general principles
  - ...and locating lots of information in the lexicon.
  - Our lexical entries currently stipulate a lot of information that is common across many entries and should be stated only once.
- Examples?
- Ideally, particular lexical entries need only give phonological form, the semantic contribution, and any constraints truly idiosyncratic to the lexical entry.

## Lexemes and Words

- Lexeme: An abstract proto-word which gives rise to genuine words. We refer to lexemes by their 'dictionary form', e.g. 'the lexeme *run*' or 'the lexeme *dog*'.
- Word: A particular pairing of form and meaning. *Running* and *ran* are different words

## Lexical Types & Lexical Rules

- Lexemes capture the similarities among *run*, *runs*, *running*, and *run*.
- The lexical type hierarchy captures the similarities among *run, sleep,* and *laugh*, among those and other verbs like *devour* and *hand*, and among those and other words like *book*.
  - Q: What do *devour* and *book* have in common?A: The SHAC
- Lexical rules capture the similarities among *runs*, *sleeps*, *devours*, *hands*,...

## Default Inheritance

- **Q**: Why do we have default inheritance?
- A: Generalizations with exceptions are common:
  - Most nouns in English aren't marked for CASE, but pronouns are.
  - Most verbs in English only distinguish two agreement categories (*3sing* and *non-3sing*), but *be* distinguishes more.
  - Most prepositions in English are transitive, but *here* and *there* are intransitive.
  - Most nominal words in English are 3rd person, but some (all of them pronouns) are 1st or 2nd person.
  - Most proper nouns in English are singular, but some (mountain range names, sports team names) are plural.

## Default Inheritance, Technicalities

If a type says ARG-ST / < NP >, and one of itsthen the ARG-STsubtypes saysvalue of instances ofARG-ST < >, the subtype is < >.

If a type says ARG-ST < NP >, and one of its subtypes says ARG-ST < >, then this subtype can have no instances, since they would have to satisfy contradictory constraints.

## Default Inheritance, More Technicalities

• If a type says MOD / < S >,

and one of its subtypes says MOD <[SPR < NP>]>,

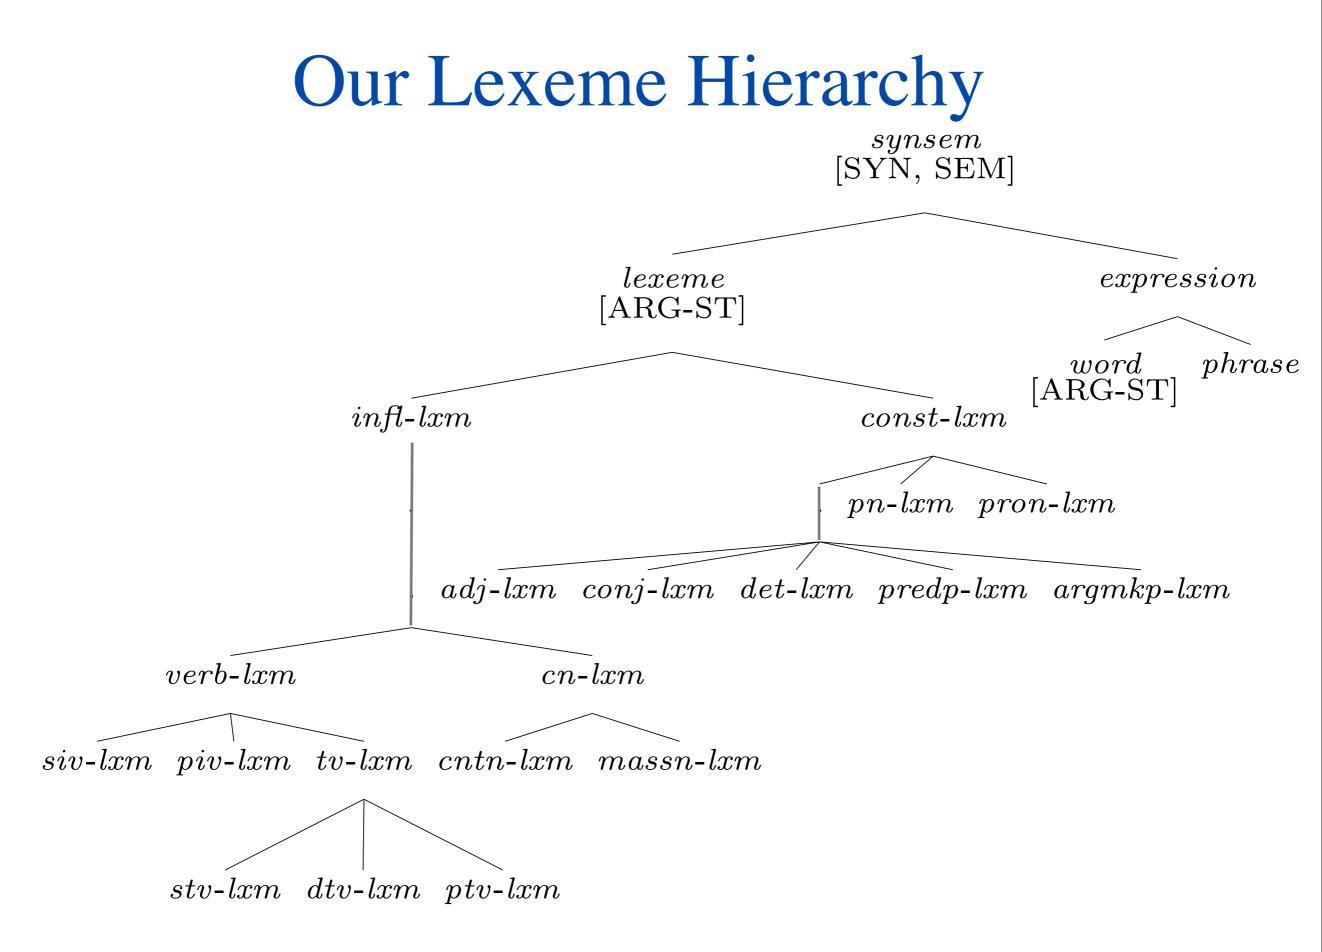

then the ARG-ST value of instances of the subtype is

$$\begin{bmatrix} MOD & \left\langle \begin{bmatrix} HEAD & / verb \\ SPR & \left\langle NP \right\rangle \\ COMPS & / \left\langle \right\rangle \end{bmatrix} \right\rangle$$

• That is, default constraints are 'pushed down'

## Question on Default Inheritance

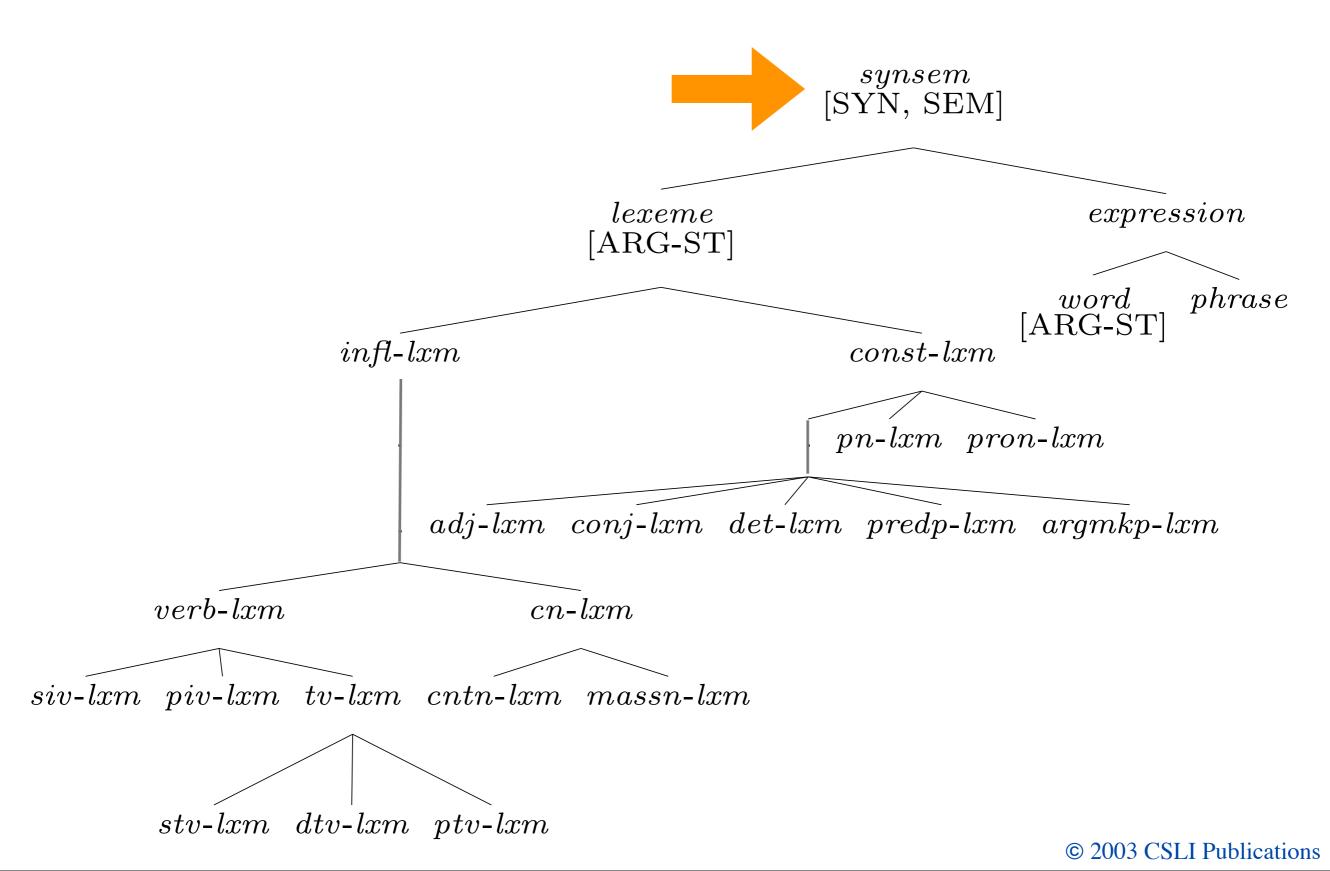

- Q: Can a grammar rule override a default constraint on a word?
- A: No. Defaults are all 'cached out' in the lexicon.
- Words as used to build sentences have only inviolable constraints.

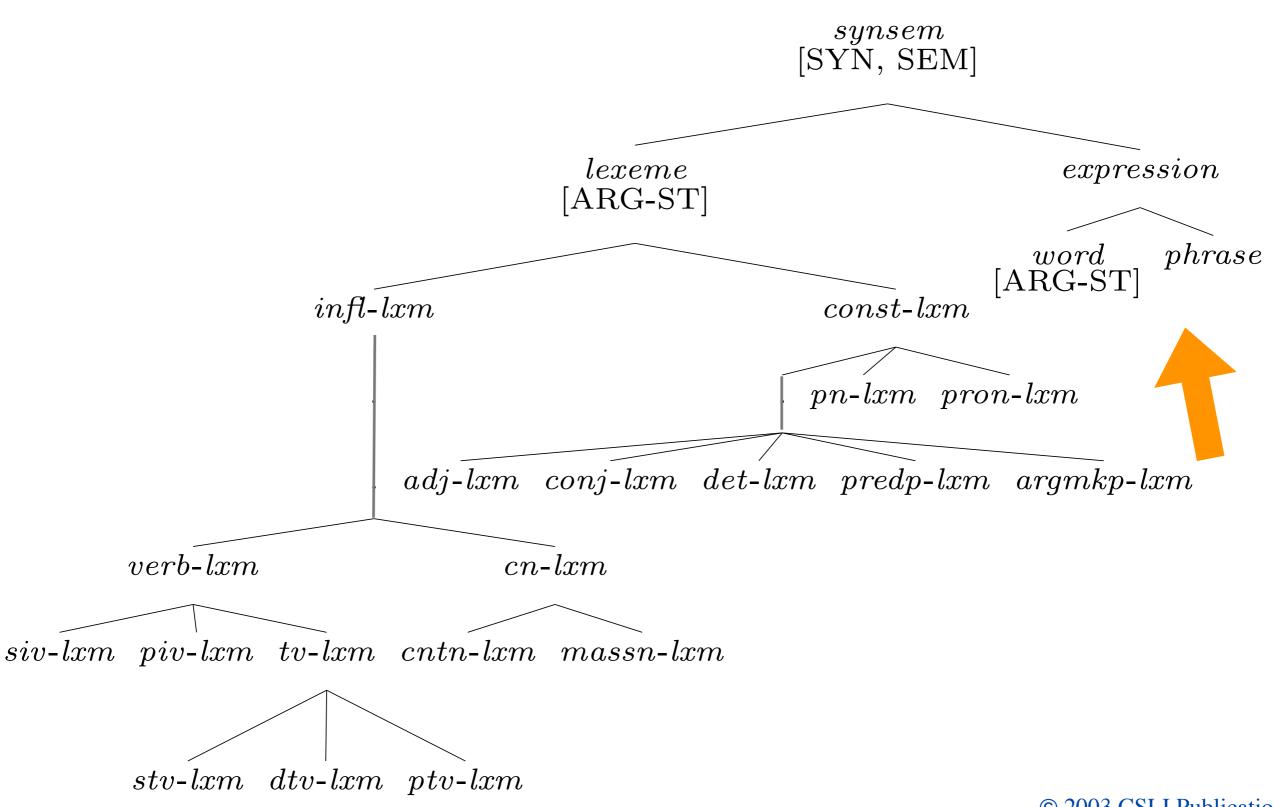

## Functions of Types

- Stating what features are appropriate for what categories
- Stating generalizations
  - Constraints that apply to (almost) all instances
  - Generalizations about selection -- where instances of that type can appear

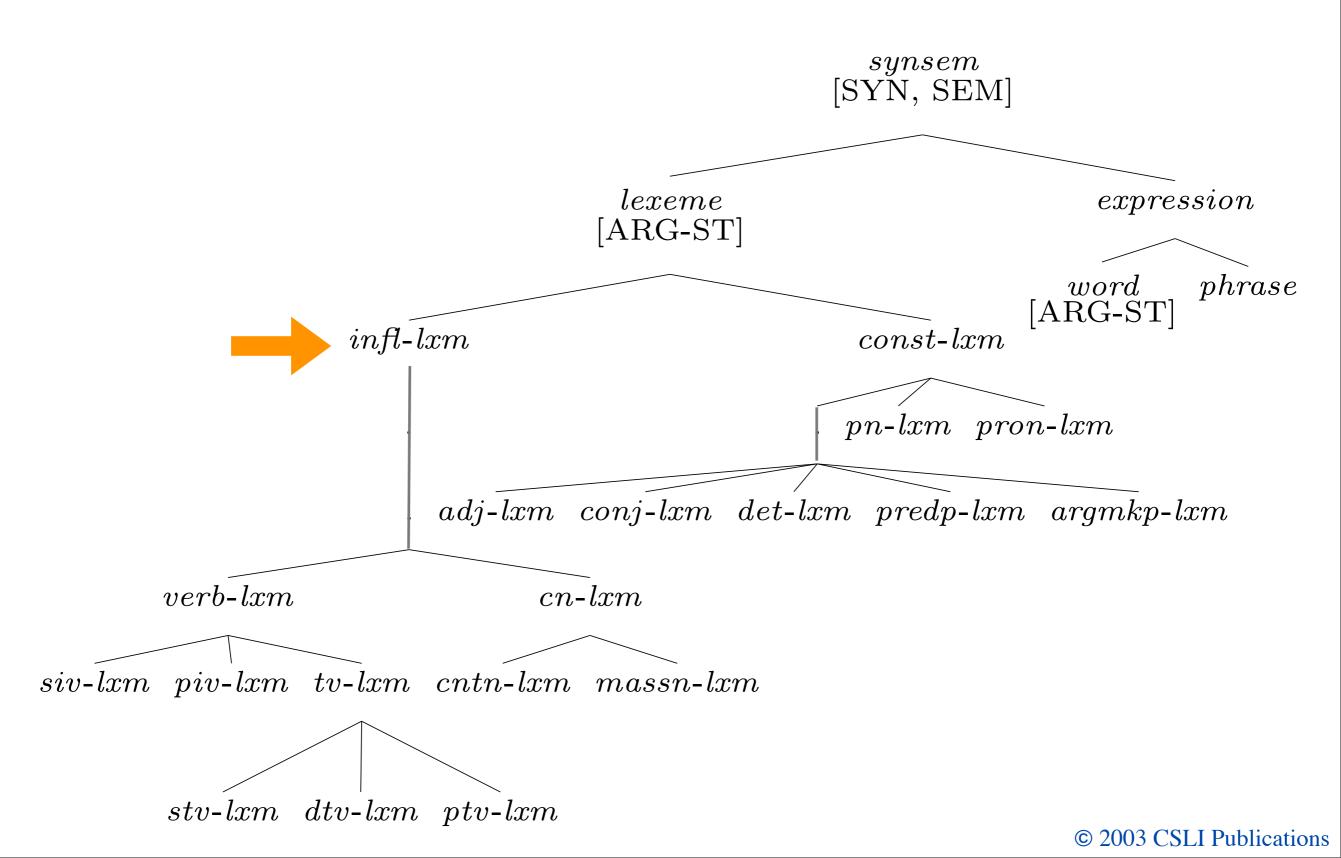

### Every synsem has the features SYN and SEM

#### No ARG-ST on phrase

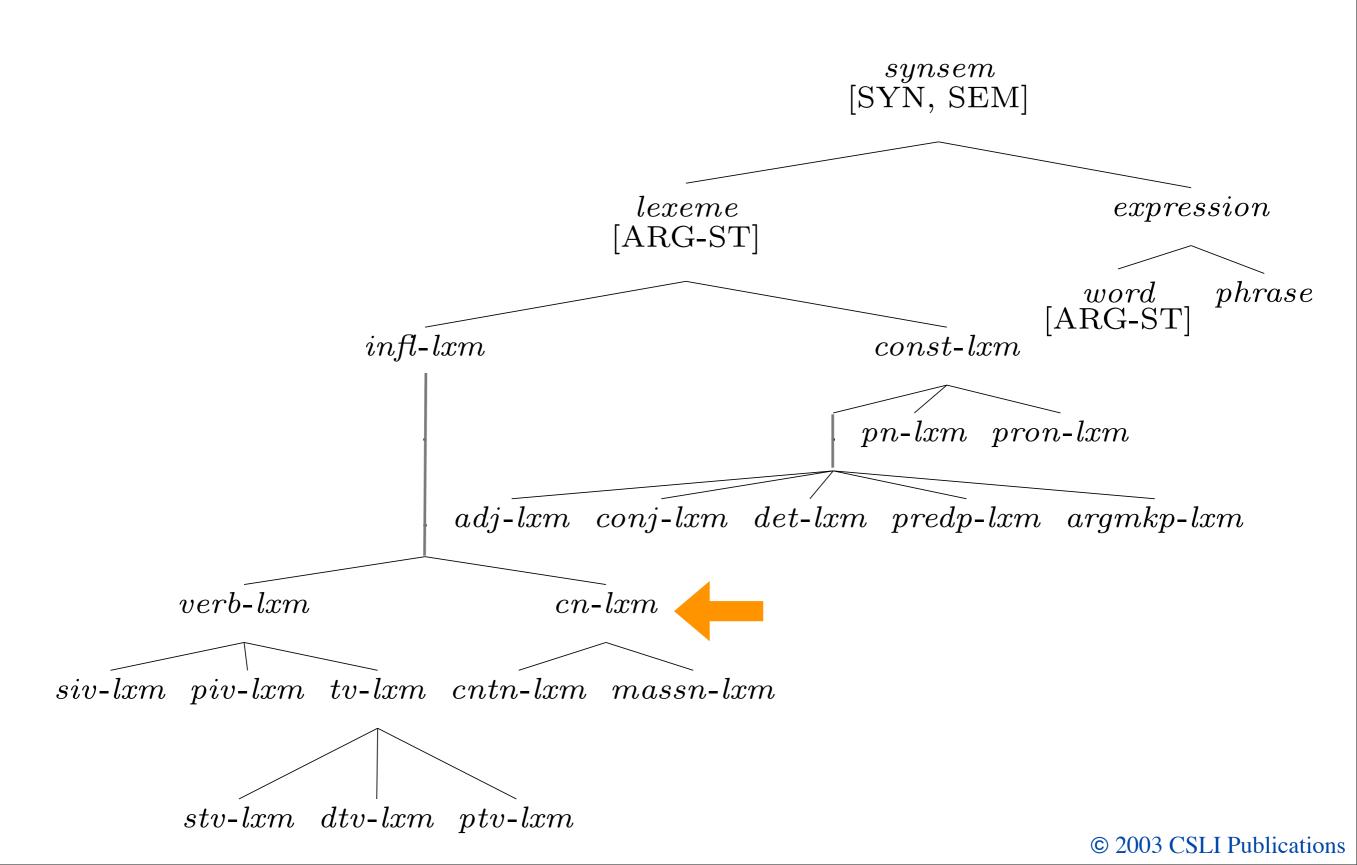

#### A Constraint on *infl-lxm*: the SHAC

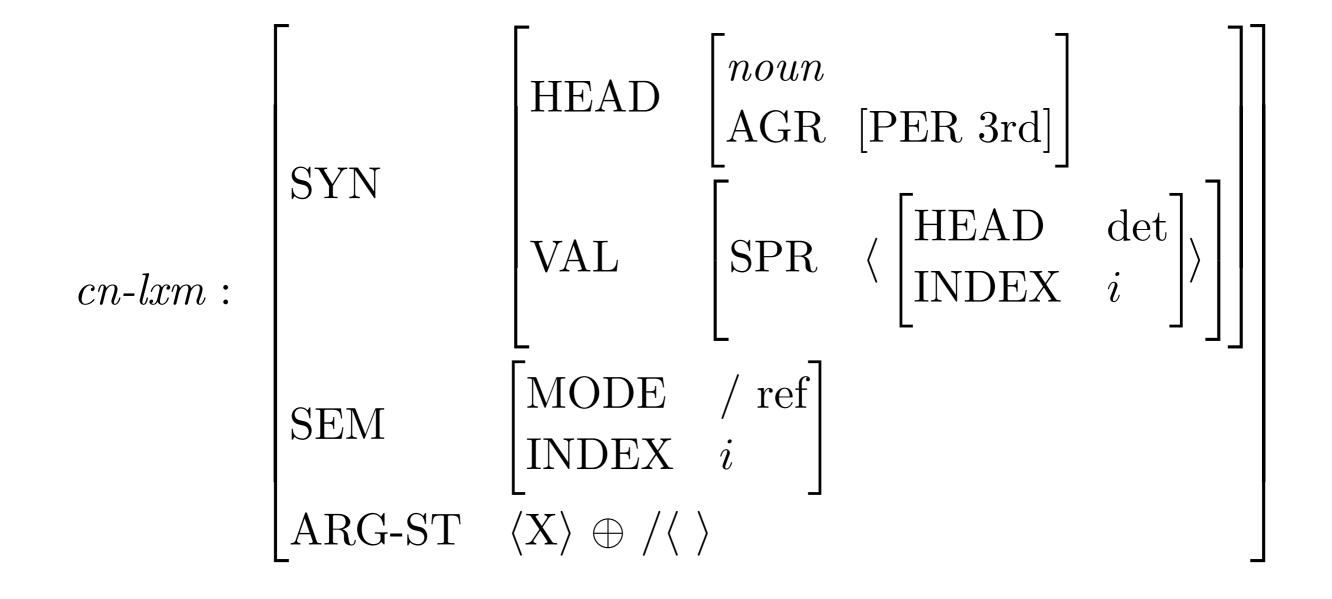

#### A Constraint on *infl-lxm*: the SHAC

$$infl-lxm: \begin{bmatrix} VAL & VAL & SPR & AGR & I \end{bmatrix} \end{bmatrix}$$
HEAD [AGR 1]

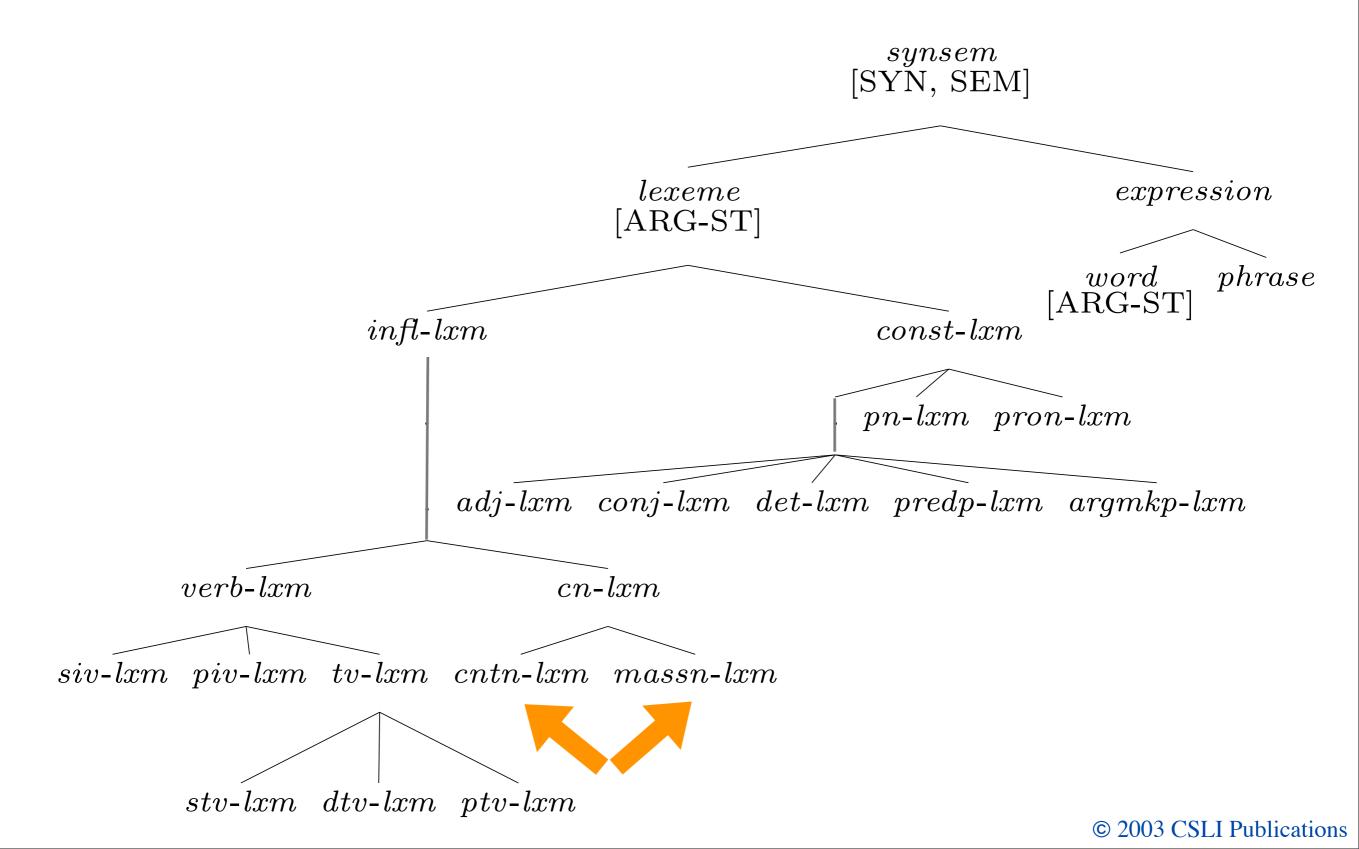

#### Constraints on cn-lxm

#### Constraints on cn-lxm

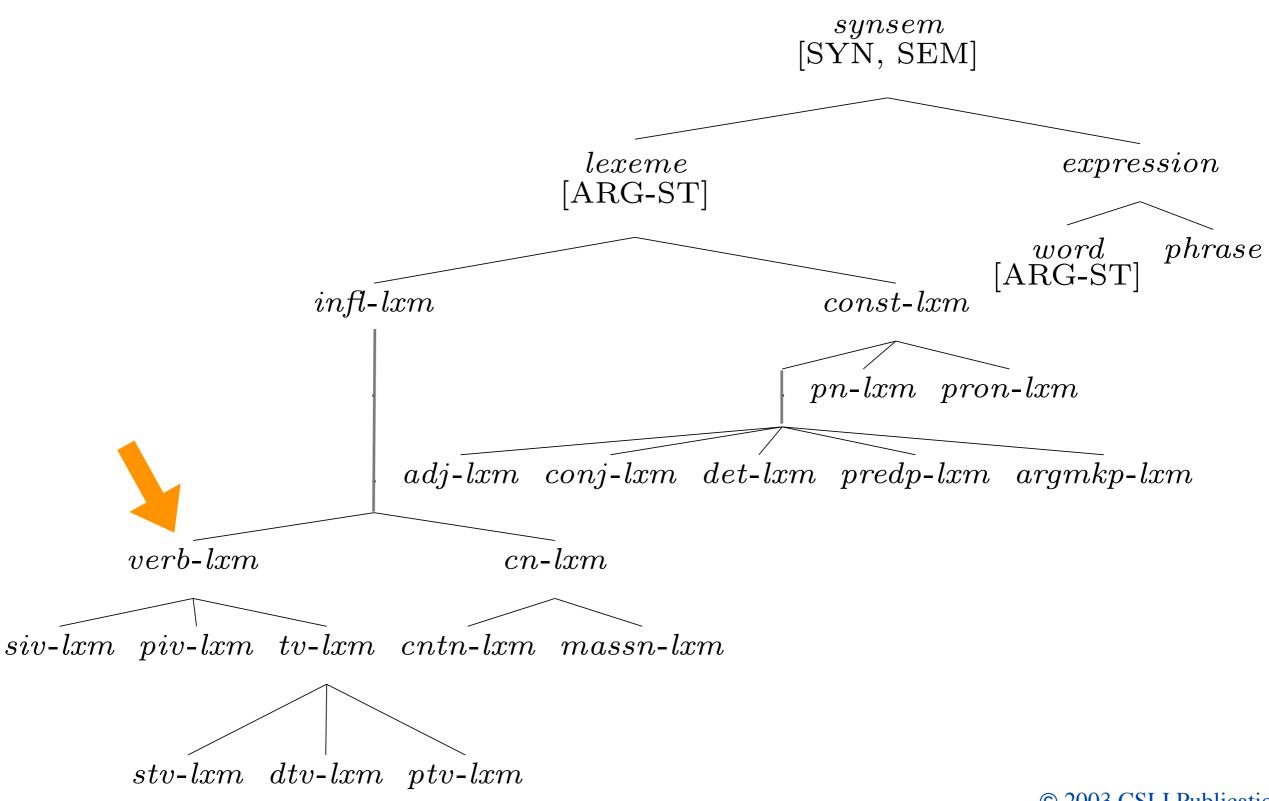

### Formally Distinguishing Count vs. Mass Nouns

#### Formally Distinguishing Count vs. Mass Nouns

$$cntn-lxm: \left[ SYN \left[ VAL \left[ SPR \langle [COUNT +] \rangle \right] \right] \right]$$
$$massn-lxm: \left[ SYN \left[ VAL \left[ SPR \langle [COUNT -] \rangle \right] \right] \right]$$

#### Constraints on verb-lxm

#### Constraints on verb-lxm

verb-lxm:SYN[HEAD verb]Nerb-lxm:SEM[MODE prop]ARG-ST/ 
$$\langle$$
 NP, ...  $\rangle$ 

Subtypes of *verb-lxm* 

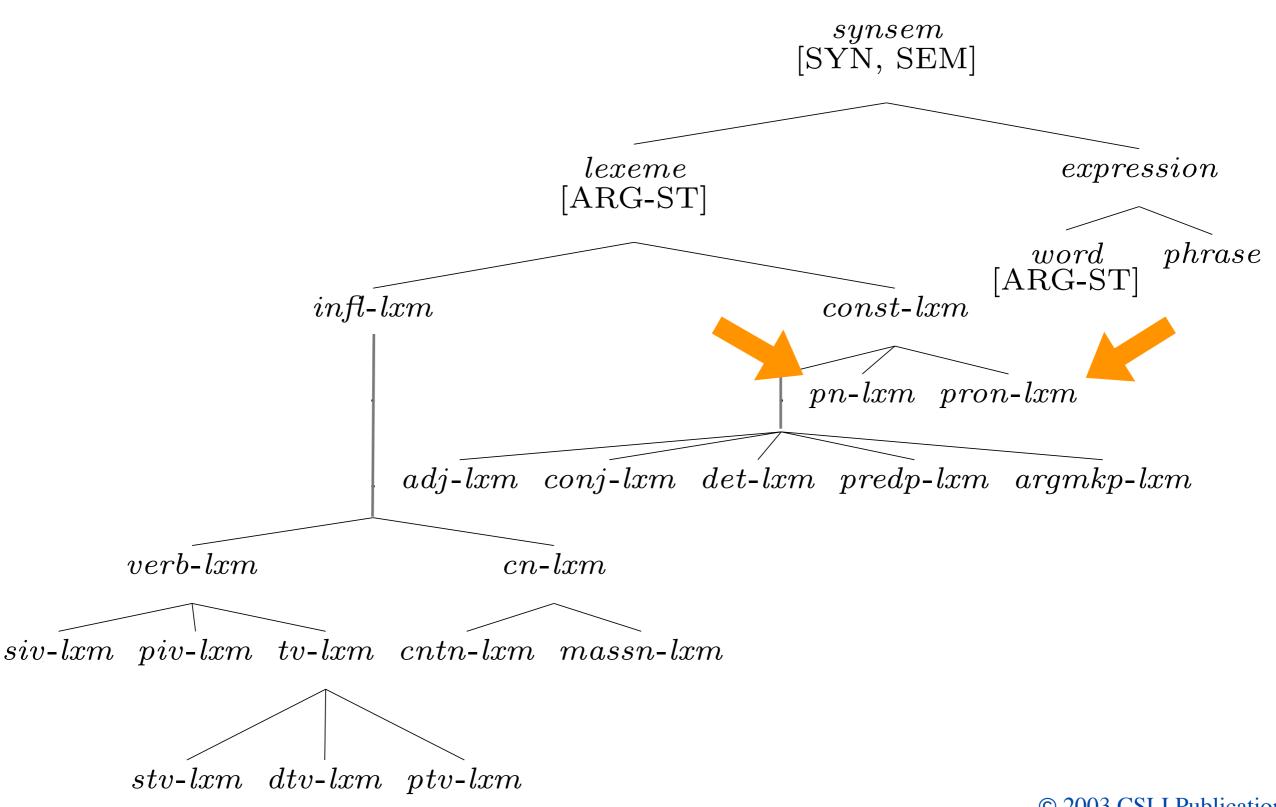

verb-lxm

siv-lxm piv-lxm tv-lxm

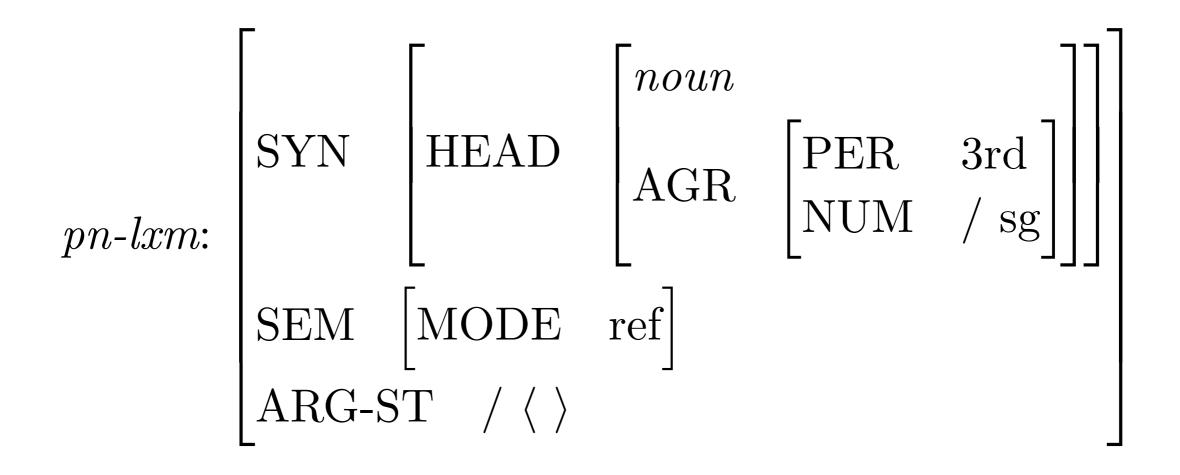

stv-lxm dtv-lxm ptv-lxm

- *verb-lxm*: [ARG-ST / < NP, ... >]
  - *siv-lxm*: [ARG-ST / < NP >]
  - *piv-lxm*: [ARG-ST / < NP, PP >]
  - tv-lxm: [ARG-ST / < NP, NP, ... >]
    - stv-lxm: [ARG-ST / < NP, NP, >]
    - dtv-lxm: [ARG-ST / < NP, NP, NP >]
    - ptv-lxm: [ARG-ST / < NP, NP, PP >]

#### **Proper Nouns and Pronouns**

#### **Proper Nouns and Pronouns**

$$pron-lxm: \begin{bmatrix} SYN & [HEAD noun] \\ SEM & [MODE / ref] \\ ARG-ST \langle \rangle \end{bmatrix}$$

## The Case Constraint

An outranked NP is [CASE acc].

- object of verb
- second object of verb
- object of argument-marking preposition
- object of predicational preposition

( )

The Case Constraint, continued An outranked NP is [CASE acc].

- Subjects of verbs
  - Should we add a clause to cover nominative subjects?
    - No.

*We expect them to leave*. (Chapter 12)

- Lexical rules for finite verbs will handle nominative subjects.
- Any other instances of case marking in English?
- Case systems in other languages? No: The Case Constraint is an English-specific constraint.

# Apparent redundancy

- Why do we need both the *pos* subhierarchy and lexeme types?
  - *pos*:
    - Applies to words and phrases; models relationship between then
    - Constrains which features are appropriate (no AUX on *noun*)
  - *lexeme*:
    - Generalizations about combinations of constraints
