

Parsing: Earley & PCFGs

Ling 571

Deep Processing Techniques for NLP

January 19, 2011

Roadmap

- Motivation I: CKY limitations
- The Earley algorithm

- Motivation II: Ambiguity
- Probabilistic Context-free Grammars (PCFGs)

CKY Algorithm

- Dynamic programming approach
 - Yields parsing in cubic time in length of input string
 - Fairly efficient
- Issues:
- \

CKY Algorithm

- Dynamic programming approach
 - Yields parsing in cubic time in length of input string
 - Fairly efficient
- Issues:
 - Requires CNF conversion
 - Limits expressiveness

CKY Algorithm

- Dynamic programming approach
 - Yields parsing in cubic time in length of input string
 - Fairly efficient
- Issues:
 - Requires CNF conversion
 - Limits expressiveness
 - Maintains ambiguity

Earley Parsing

- Avoid repeated work/recursion problem
 - Dynamic programming
 - Store partial parses in “chart”
 - Compactly encodes ambiguity
 - $O(N^3)$
- Chart entries:
 - Subtree for a single grammar rule
 - Progress in completing subtree
 - Position of subtree wrt input

Earley Algorithm

- Uses dynamic programming to do parallel top-down search in (worst case) $O(N^3)$ time
- First, left-to-right pass fills out a chart with $N + 1$ states
 - Think of chart entries as sitting between words in the input string keeping track of states of the parse at these positions
 - For each word position, chart contains set of states representing all partial parse trees generated to date. E.g. `chart[0]` contains all partial parse trees generated at the beginning of the sentence

Chart Entries

Represent three types of constituents:

- predicted constituents
- in-progress constituents
- completed constituents

Parse Progress

- Represented by Dotted Rules
- Position of • indicates type of constituent
- $_0$ Book $_1$ that $_2$ flight $_3$
 - $S \rightarrow \bullet VP$, [0,0] (predicted)
 - $NP \rightarrow Det \bullet Nom$, [1,2] (in progress)
 - $VP \rightarrow V NP \bullet$, [0,3] (completed)
- [x,y] tells us what portion of the input is spanned so far by this rule
- **Each State s_i :**
<dotted rule>, [<back pointer>, <current position>]

0 Book 1 that 2 flight 3

S → • VP, [0,0]

- First 0 means S constituent begins at the start of input
- Second 0 means the dot here too
- So, this is a top-down prediction

NP → Det • Nom, [1,2]

- the NP begins at position 1
- the dot is at position 2
- so, Det has been successfully parsed
- Nom predicted next

0 Book 1 that 2 flight 3
(continued)

VP \rightarrow V NP •, [0,3]

- Successful VP parse of entire input

Successful Parse

- Final answer found by looking at last entry in chart
- If entry resembles $S \rightarrow \alpha \cdot [0, N]$ then input parsed successfully
- Chart will also contain record of all possible parses of input string, given the grammar

Parsing Procedure for the Earley Algorithm

- Move through each set of states in order, applying one of three operators to each state:
 - **predictor:** add predictions to the chart
 - **scanner:** read input and add corresponding state to chart
 - **completer:** move dot to right when new constituent found
- Results (new states) added to current or next set of states in chart
- No backtracking and no states removed: keep complete history of parse

States and State Sets

- **Dotted Rule** s_i represented as $\langle \text{dotted rule} \rangle, [\langle \text{back pointer} \rangle, \langle \text{current position} \rangle]$
- **State Set** S_j to be a collection of states s_i with the same $\langle \text{current position} \rangle$.

Earley Algorithm from Book

```
function EARLEY-PARSE(words, grammar) returns chart

  ENQUEUE( $(\gamma \rightarrow \bullet S, [0,0])$ , chart[0])
  for  $i \leftarrow$  from 0 to LENGTH(words) do
    for each state in chart[ $i$ ] do
      if INCOMPLETE?(state) and
        NEXT-CAT(state) is not a part of speech then
        PREDICTOR(state)
      elseif INCOMPLETE?(state) and
        NEXT-CAT(state) is a part of speech then
        SCANNER(state)
      else
        COMPLETER(state)
    end
  end
  return(chart)
```

Earley Algorithm from Book

```
procedure PREDICTOR( $(A \rightarrow \alpha \bullet B \beta, [i, j])$ )  
  for each  $(B \rightarrow \gamma)$  in GRAMMAR-RULES-FOR( $B, grammar$ ) do  
    ENQUEUE( $(B \rightarrow \bullet \gamma, [j, j])$ ,  $chart[j]$ )  
  end  
  
procedure SCANNER( $(A \rightarrow \alpha \bullet B \beta, [i, j])$ )  
  if  $B \subset$  PARTS-OF-SPEECH( $word[j]$ ) then  
    ENQUEUE( $(B \rightarrow word[j], [j, j+1])$ ,  $chart[j+1]$ )  
  
procedure COMPLETER( $(B \rightarrow \gamma \bullet, [j, k])$ )  
  for each  $(A \rightarrow \alpha \bullet B \beta, [i, j])$  in  $chart[j]$  do  
    ENQUEUE( $(A \rightarrow \alpha B \bullet \beta, [i, k])$ ,  $chart[k]$ )  
  end
```

Earley Algorithm (simpler!)

1. Add $\text{Start} \rightarrow \cdot S, [0,0]$ to state set 0
Let $i=1$
2. **Predict** all states you can, adding new predictions to state set 0
3. **Scan** input word i —add all matched states to state set S_i .
Add all new states produced by **Complete** to state set S_i
Add all new states produced by **Predict** to state set S_i
Let $i = i + 1$
Unless $i=n$, repeat step 3.
4. At the end, see if state set n contains $\text{Start} \rightarrow S \cdot, [0,n]$

3 Main Sub-Routines of Earley Algorithm

- **Predictor:** Adds predictions into the chart.
- **Completer:** Moves the dot to the right when new constituents are found.
- **Scanner:** Reads the input words and enters states representing those words into the chart.

Predictor

- Intuition: create new state for top-down prediction of new phrase.
- Applied when non part-of-speech non-terminals are to the right of a dot: **S** → • **VP** [0,0]
- Adds new states to *current* chart
 - One new state for each expansion of the non-terminal in the grammar
 - VP** → • **V** [0,0]
 - VP** → • **V NP** [0,0]
- Formally:
 - $S_j: A \rightarrow \alpha \cdot B \beta, [i, j]$
 - $S_j: B \rightarrow \cdot \gamma, [j, j]$

Scanner

- Intuition: Create new states for rules matching part of speech of next word.
- Applicable when part of speech is to the right of a dot: $VP \rightarrow \cdot V NP [0,0]$ ‘Book...’
- Looks at current word in input
- If match, adds state(s) to *next* chart
 $VP \rightarrow V \cdot NP [0,1]$
- Formally:
$$S_j: A \rightarrow \alpha \cdot B \beta, [i,j]$$
$$S_{j+1}: A \rightarrow \alpha B \cdot \beta, [i,j+1]$$

Completer

- Intuition: parser has finished a new phrase, so must find and advance states all that were waiting for this
- Applied when dot has reached right end of rule
 $NP \rightarrow \text{Det Nom} \cdot [1,3]$
- Find all states w/dot at 1 and expecting an NP:
 $VP \rightarrow V \cdot NP [0,1]$
- Adds new (completed) state(s) to *current* chart :
 $VP \rightarrow V NP \cdot [0,3]$
- Formally: $S_k: B \rightarrow \delta \cdot, [j,k]$
 $S_k: A \rightarrow \alpha B \cdot \beta, [i,k],$
where: $S_j: A \rightarrow \alpha \cdot B \beta, [i,j].$

Chart[0]

S0	$\gamma \rightarrow \bullet S$	[0,0]	Dummy start state
S1	$S \rightarrow \bullet NP VP$	[0,0]	Predictor
S2	$S \rightarrow \bullet Aux NP VP$	[0,0]	Predictor
S3	$S \rightarrow \bullet VP$	[0,0]	Predictor
S4	$NP \rightarrow \bullet Pronoun$	[0,0]	Predictor
S5	$NP \rightarrow \bullet Proper-Noun$	[0,0]	Predictor
S6	$NP \rightarrow \bullet Det Nominal$	[0,0]	Predictor
S7	$VP \rightarrow \bullet Verb$	[0,0]	Predictor
S8	$VP \rightarrow \bullet Verb NP$	[0,0]	Predictor
S9	$VP \rightarrow \bullet Verb NP PP$	[0,0]	Predictor
S10	$VP \rightarrow \bullet Verb PP$	[0,0]	Predictor
S11	$VP \rightarrow \bullet VP PP$	[0,0]	Predictor

Note that given a grammar, these entries are the same for all inputs; they can be pre-loaded.

Chart[1]

S12	$Verb \rightarrow book \bullet$	[0,1]	Scanner
S13	$VP \rightarrow Verb \bullet$	[0,1]	Completer
S14	$VP \rightarrow Verb \bullet NP$	[0,1]	Completer
S15	$VP \rightarrow Verb \bullet NP PP$	[0,1]	Completer
S16	$VP \rightarrow Verb \bullet PP$	[0,1]	Completer
S17	$S \rightarrow VP \bullet$	[0,1]	Completer
S18	$VP \rightarrow VP \bullet PP$	[0,1]	Completer
S19	$NP \rightarrow \bullet Pronoun$	[1,1]	Predictor
S20	$NP \rightarrow \bullet Proper-Noun$	[1,1]	Predictor
S21	$NP \rightarrow \bullet Det Nominal$	[1,1]	Predictor
S22	$PP \rightarrow \bullet Prep NP$	[1,1]	Predictor

Charts[2] and [3]

S23	<i>Det</i> → <i>that</i> •	[1,2]	Scanner
S24	<i>NP</i> → <i>Det</i> • <i>Nominal</i>	[1,2]	Completer
S25	<i>Nominal</i> → • <i>Noun</i>	[2,2]	Predictor
S26	<i>Nominal</i> → • <i>Nominal Noun</i>	[2,2]	Predictor
S27	<i>Nominal</i> → • <i>Nominal PP</i>	[2,2]	Predictor
S28	<i>Noun</i> → <i>flight</i> •	[2,3]	Scanner
S29	<i>Nominal</i> → <i>Noun</i> •	[2,3]	Completer
S30	<i>NP</i> → <i>Det Nominal</i> •	[1,3]	Completer
S31	<i>Nominal</i> → <i>Nominal</i> • <i>Noun</i>	[2,3]	Completer
S32	<i>Nominal</i> → <i>Nominal</i> • <i>PP</i>	[2,3]	Completer
S33	<i>VP</i> → <i>Verb NP</i> •	[0,3]	Completer
S34	<i>VP</i> → <i>Verb NP</i> • <i>PP</i>	[0,3]	Completer
S35	<i>PP</i> → • <i>Prep NP</i>	[3,3]	Predictor
S36	<i>S</i> → <i>VP</i> •	[0,3]	Completer
S37	<i>VP</i> → <i>VP</i> • <i>PP</i>	[0,3]	Completer

How do we retrieve the parses at the end?

- Augment the Completer to add pointers to prior states it advances as a field in the current state
 - i.e. what state did we advance here?
 - Read the pointers back from the final state

- What about ambiguity?

- What about ambiguity?
- CKY/Earley can represent it

- What about ambiguity?
- CKY/Earley can represent it
- Can't resolve it

Probabilistic Parsing

- Provides strategy for solving disambiguation problem
 - Compute the probability of all analyses
 - Select the most probable
- Employed in language modeling for speech recognition
 - N-gram grammars predict words, constrain search
 - Also, constrain generation, translation

PCFGs

- Probabilistic Context-free Grammars
 - Augmentation of CFGs

N a set of **non-terminal symbols** (or **variables**)

Σ a set of **terminal symbols** (disjoint from N)

R a set of **rules** or productions, each of the form $A \rightarrow \beta [p]$,

where A is a non-terminal,

β is a string of symbols from the infinite set of strings $(\Sigma \cup N)^*$,

and p is a number between 0 and 1 expressing $P(\beta|A)$

S a designated **start symbol**

PCFGs

- Augments each production with probability that LHS will be expanded as RHS
 - $P(A \rightarrow B)$ or $P(A \rightarrow B | A)$, $p(\text{RHS} | \text{LHS})$
 - Sum over all possible expansions is 1

$$\sum_{\beta} P(A \rightarrow \beta) = 1$$

- A PCFG is consistent if sum of probabilities of all sentences in language is 1.
 - Recursive rules often yield inconsistent grammars

Disambiguation

- A PCFG assigns probability to each parse tree T for input S .
 - Probability of T : product of all rules to derive T

$$P(T, S) = \prod_{i=1}^n P(RHS_i | LHS_i)$$

$$P(T, S) = P(T)P(S | T) = P(T)$$

Formalizing Disambiguation

- Select T such that:

$$\hat{T}(S) = \underset{T \text{ s.t. } S = \text{yield}(T)}{\operatorname{argmax}} P(T)$$

- String of words S is *yield* of parse tree over S
- Select tree that maximizes probability of parse

Learning Probabilities

- Simplest way:
 - Treebank of parsed sentences
 - To compute probability of a rule, count:
 - Number of times non-terminal is expanded
 - Number of times non-terminal is expanded by given rule

$$P(\alpha \rightarrow \beta | \alpha) = \frac{\text{Count}(\alpha \rightarrow \beta)}{\sum_{\gamma} \text{Count}(\alpha \rightarrow \gamma)} = \frac{\text{Count}(\alpha \rightarrow \beta)}{\text{Count}(\alpha)}$$

- Alternative: Learn probabilities by re-estimating
 - (Later)

Example PCFG

$VP \rightarrow Verb$	[.35]	$Aux \rightarrow does [.60] \mid can [.40]$
$VP \rightarrow Verb NP$	[.20]	$Preposition \rightarrow from [.30] \mid to [.30]$
$VP \rightarrow Verb NP PP$	[.10]	$\mid on [.20] \mid near [.15]$
$VP \rightarrow Verb PP$	[.15]	$\mid through [.05]$
$VP \rightarrow Verb NP NP$	[.05]	
$VP \rightarrow VP PP$	[.15]	
$PP \rightarrow Preposition NP$	[1.0]	

Issues with PCFGs

- Independence assumptions:
 - Rule expansion is context-independent
 - Allows us to multiply probabilities
- Is this valid?

Issues with PCFGs

- Independence assumptions:
 - Rule expansion is context-independent
 - Allows us to multiply probabilities
- Is this valid?

	Pronoun	Non-pronoun
Subject	91%	9%
Object		

Issues with PCFGs

- Independence assumptions:
 - Rule expansion is context-independent
 - Allows us to multiply probabilities
- Is this valid?

	Pronoun	Non-pronoun
Subject	91%	9%
Object	34%	66%

Issues with PCFGs

- Independence assumptions:
 - Rule expansion is context-independent
 - Allows us to multiply probabilities

- Is this valid?

	Pronoun	Non-pronoun
Subject	91%	9%
Object	34%	66%

- In Treebank: roughly equi-probable
- How can we handle this?

Issues with PCFGs

- Is this valid?

	Pronoun	Non-pronoun
Subject	91%	9%
Object	34%	66%

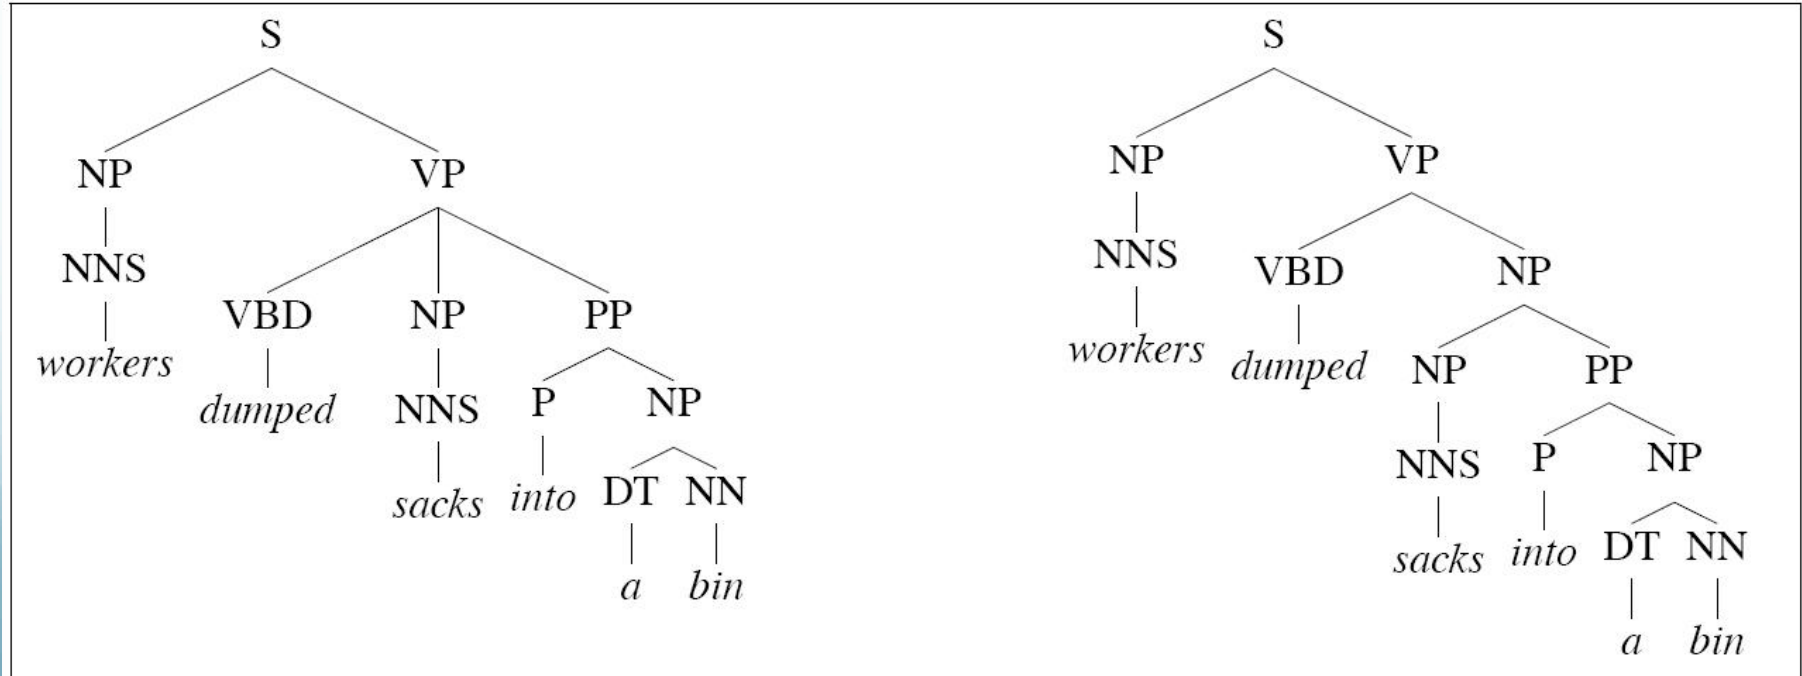

- In Treebank: roughly equi-probable
- How can we handle this?
 - Condition on Subj/Obj with parent annotation

Issues with PCFGs

- Insufficient lexical conditioning
 - Present in pre-terminal rules
- Are there cases where other rules should be conditioned on words?

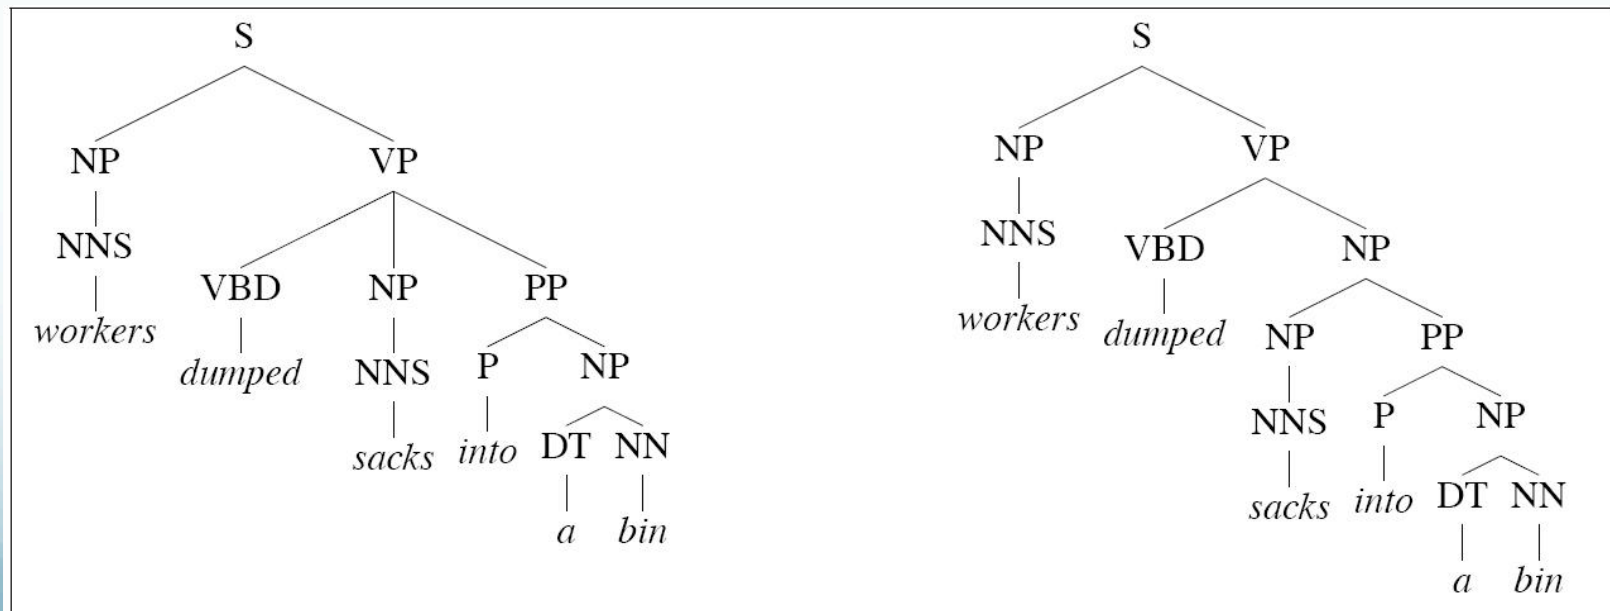

Issues with PCFGs

- Insufficient lexical conditioning
 - Present in pre-terminal rules
- Are there cases where other rules should be conditioned on words?

Issues with PCFGs

- Insufficient lexical conditioning
 - Present in pre-terminal rules
- Are there cases where other rules should be conditioned on words?

Different verbs & prepositions have different attachment preferences

PCFGs

- Augment parsers to handle probabilities
- Adapt PCFGs to handle
 - Structural dependencies
 - By splitting nodes
 - Lexical dependencies
 - By lexicalizing PCFGs
