

# Chapter 12: Structures of Ceramics

## Outline

- Introduction
- Crystal structures
  - Ceramic structure
  - AX-type crystal structures
  - $A_mX_p$ -type
  - $A_mB_nX_p$ -type
- Silicate ceramics
- Carbon

# Ceramics

- Two or more different elements
- More complex than metal structures
- Ionic and/or covalent bonds
- A mix of ionic and covalent bonds -- electronegativity
- Ionic bonds form ions
  - Metals donate electrons --metallic ions-- cations--positively charged
  - Non-metals gain electrons --nonmetallic ions--anions--negatively charged
- Crystals must be electrically neutral, e.g.  $\text{CaF}_2$

# Ceramic Bonding

- Bonding:
  - Mostly ionic, some covalent.
  - % ionic character increases with difference in electronegativity.
- Large vs small ionic bond character:

IA																		0
H																		He
2.1	IIA											IIIA	IVA	VA	VIA	VIIA		-
Li	Be											B	C	N	O	F	Ne	-
1.0	1.5											2.0	2.5	3.0	3.5	4.0	-

# Ionic Bonding & Structure

- **Charge Neutrality:**

--Net charge in the structure should be zero.

--General form:

m, p determined by charge neutrality

# Ceramic structures

- **Factors that influence crystal structure**
  - Magnitude of electrical charge of ions
  - Relative size of ions (Non-metal > metal ions  $R_c/R_a < 1$ )
    - **Cations must be next to anions--maximize # of nearest neighbors that are anions**
    - **Stable structure--anions and cations must contact each other**

unstable

stable

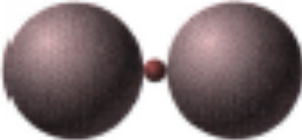

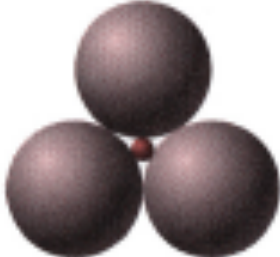

stable

Callister 7e.

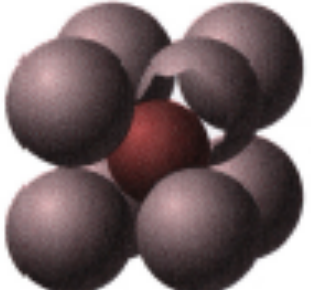

**The # of anions depends on ratio of  $R_c/R_a$**

# Coordination numbers and geometries for various cation-anion radius ratios ( $R_c/R_a$ )

**Table 13.2** Coordination Numbers and Geometries for Various Cation–Anion Radius Ratios ( $r_c/r_a$ )

<i>Coordination Number</i>	<i>Cation–Anion Radius Ratio</i>	<i>Coordination Geometry</i>
2	$<0.155$	
3	$0.155–0.225$	
4	$0.225–0.414$	

**Table 13.2** Coordination Numbers and Geometries for Various Cation–Anion Radius Ratios ( $r_c/r_a$ )

<i>Coordination Number</i>	<i>Cation–Anion Radius Ratio</i>	<i>Coordination Geometry</i>
6	$0.414–0.732$	
8	$0.732–1.0$	

# AX-type crystal structure

Rock Salt

NaCl structure

Adapted from Fig.  
12.2, *Callister 7e*.

$$r_{\text{Na}} = 0.102 \text{ nm}$$

$$r_{\text{Cl}} = 0.181 \text{ nm}$$

$$r_{\text{Na}}/r_{\text{Cl}} = 0.564$$

C # =

Unit cell: FCC arrangement  
of anions with one cation at  
center of each of 12 cube  
edges

Two interpenetrating FCC  
lattices

# AX Crystal Structures

AX-Type Crystal Structures include NaCl, CsCl, and zinc blende

Cesium Chloride structure:

$$\frac{r_{\text{Cs}^+}}{r_{\text{Cl}^-}} = \frac{0.170}{0.181} = 0.939$$

Each Cs<sup>+</sup> has 8 neighboring Cl<sup>-</sup>

Adapted from Fig.  
12.3, *Callister 7e*.

# AX Crystal Structures

## Zinc Blende structure

Adapted from Fig.  
12.4, *Callister 7e*.

Ex: ZnO, ZnS, SiC

$$\frac{r_{\text{Zn}^{2+}}}{r_{\text{O}^{2-}}} = \frac{0.074}{0.140} = 0.529$$

C#=4,  
FCC structure of S with Zn at  
interior tetrahedral

# $A_mX_p$ Crystal Structures

## Fluorite structure ( $AX_2$ )

Adapted from Fig.  
12.5, *Callister 7e*.

- Calcium Fluorite ( $CaF_2$ )
- cations in cubic sites
- $UO_2$ ,  $ThO_2$ ,  $ZrO_2$ ,  $CeO_2$
- $R_c/R_a=0.8$ ,  $C \#_{Ca}=8$ ,  $C \#_F=4$
- Ca atoms at center of cubes with F atoms at cube corners.
- Unit cell consists of 8 cubes

# $A_m B_n X_p$ Crystal Structures

## Perovskite ( $ABX_3$ )

- Ba at cubic corner, O at center of 6 faces, Ti at body center
- $CN_O=12$ ,  $CN_{Ba}=6$ , and  $CN_{Ti}=6$
- Large A cation and oxygen form an FCC lattice
- Cubic--tetragonal at 130°C (Curie points)
- Cubic -- orthrhombic and rhombohedral at low T

Adapted from Fig.  
12.6, Callister 7e.

## Ceramic density computations

$$\rho = \frac{n'(\Sigma A_C + \Sigma A_A)}{V_C N_A} \quad (13.1)$$

where

$n'$  = the number of formula units<sup>1</sup> within the unit cell

$\Sigma A_C$  = the sum of the atomic weights of all cations in the formula unit

$\Sigma A_A$  = the sum of the atomic weights of all anions in the formula unit

$V_C$  = the unit cell volume

$N_A$  = Avogadro's number,  $6.023 \times 10^{23}$  formula units/mol

# Ceramic density computation

(example Rock Salt)

# Silicate Ceramics

Most common elements on earth are Si & O

- $\text{SiO}_2$  (silica) structures are quartz, cristobalite, & tridymite
- The strong Si-O bond leads to a strong, high melting material ( $1710^\circ\text{C}$ )

# Amorphous Silica

- Silica gels - amorphous  $\text{SiO}_2$ 
  - $\text{Si}^{4+}$  and  $\text{O}^{2-}$  not in well-ordered lattice
  - Charge balanced by  $\text{H}^+$  (to form  $\text{OH}^-$ ) at “dangling” bonds
    - very high surface area  $> 200 \text{ m}^2/\text{g}$
  - $\text{SiO}_2$  is quite stable, therefore unreactive
    - makes good catalyst support

Adapted from F  
12.11, Callister

# Silicates

- Combine  $\text{SiO}_4^{4-}$  tetrahedra by having them share corners, edges, or faces

Adapted from Fig. 12.12, *Callister 7e*.

- Cations such as  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ , &  $\text{Al}^{3+}$  act to neutralize & provide ionic bonding

# Layered Silicates

- Layered silicates (clay silicates)
  - $\text{SiO}_4$  tetrahedra connected together to form 2-D plane

- $(\text{Si}_2\text{O}_5)^{2-}$
- So need cations to balance charge

=

Adapted from Fig. 12.13, Callister 7e.

# Carbon Forms

- Carbon black – amorphous – surface area ca. 1000 m<sup>2</sup>/g
- Diamond
  - tetrahedral carbon
    - hard – no good slip planes
    - brittle – can cut it
  - large diamonds – jewelry
  - small diamonds
    - often man made - used for cutting tools and polishing
  - diamond films
    - hard surface coat – tools, medical devices, etc.

Adapted from Fig.  
12.15, *Callister 7e*.

# Diamonds!

100 m \$

120 m

# Carbon Forms - Graphite

- layer structure – aromatic layers

Adapted from Fig.  
12.17, *Callister 7e*.

- weak van der Waal's forces between layers
- planes slide easily, good lubricant

# Graphite!

# Graphene?

# Carbon Forms – Fullerenes and Nanotubes

- Fullerenes or carbon nanotubes
  - wrap the graphene sheet by curving into ball or tube
  - Buckminsterfullerenes
    - Like a soccer ball  $C_{60}$  - also  $C_{70}$  + others

Adapted from Figs.  
12.18 & 12.19,  
*Callister 7e.*

# Nanotubes
